Borer Rebuild Program

We started out as a mining rebuild company and today we continue that tradition with our expertise in rebuilding Marietta, Goodman, and Joy underground continuous and drum borers. We offer complete rebuild services including disassembly, reassembly and testing of complete borers in our new rebuild facility complete with a 50T crane.

From the welding, stress relieving and horizontal boring of a main rotor gear case to the manufacturing of a top bar/bottom bar and relative cylinders, we are capable of turning around a complete rebuild in less than 4 months as our project managers keep you updated on your borer rebuild. We also stock many components including gears, bushings and shafts.
